Removal

1. Grip the HOLD tab with thumb and finger of one hand to stabilize device and securement feet beneath skin
2. Pry upward at edge of LIFT tab with index finger tip of other hand and thumb placed at center to release cover from base
3. Remove the catheter
4. Hold pressure at site to achieve hemostasis

Fold Option

Can be used with or without catheter in place

- Apply firm pressure at the insertion site to keep tissue still
- Fold wings downward to bring feet together under the skin

Split Option

Catheter must be removed first

- Use a blunt tip scissors to cut base completely in half lengthwise along the groove
- Securement feet are shaped like an “L” with the feet extending 5mm to each side of the insertion site

- Hold folded base horizontal to skin
- Use swift, deliberate upward motion to remove following the shape of the feet

Your catheter is secured with the SecurAcath® subcutaneous engineered stabilization device.

About the SecurAcath device:
• The SecurAcath has small, blunt, flexible securement feet beneath the skin which act to stabilize the catheter right where it enters the body
• The SecurAcath is designed to secure the catheter for the entire duration of therapy, eliminate catheter movement or dislodgement, and prevent therapy interruption
• Do not remove the SecurAcath
• SecurAcath does not need to be changed. Consider it part of the catheter
• You can have an MRI with the SecurAcath in place
• The SecurAcath will be removed when the catheter is removed

Care and Maintenance

Important points:
• Follow local/hospital protocols
• The SecurAcath can be gently lifted up off the skin to allow for 360 degree cleaning around the catheter insertion site
• Do not twist or rotate the SecurAcath device from its original position during site cleaning
• Place semi-permeable transparent dressing on somewhat loosely. If the dressing is applied too tightly, it can cause discomfort
• Transparent dressing should cover the insertion site, SecurAcath, and catheter up to the suture wings. Only the extension tubes should be outside the dressing to prevent pulling or kinking of the catheter
• If there is any pain at the insertion site, try changing the dressing. Make sure the SecurAcath is lying flat on the skin and has not shifted from its original position. Replace transparent dressing, making sure it is not too tight
• If the catheter or SecurAcath has migrated from original placement, contact your healthcare provider
